NEOBULLE MEETS SAFETY STANDARDS

- **WARNING** : Your balance may be affected by your movements and those of your baby.
- **WARNING** : Be careful when leaning forward.
- **WARNING** : If you want to wear a very young baby (less than four months old), make sure that his head is hold in a safe way.
- **WARNING** : Not suitable for use when playing sport or for other strenuous physical activity.
- **WARNING** : Do not cover the face and the nose of your baby : asphyxia danger
- **WARNING** : The baby's head must be hold straight, not bend on his chest.

////////////////////// IMPORTANT ! ////////////////////////

- **Especially for babies younger than 4 months old :**
 - Your baby should be in a supported squat position (see page 9) with their head resting naturally on your chest.
 - The fabric **should be pulled up to your baby's ears and should be perfectly spread out across its width** (see page 9) in order to properly support your baby's legs, bottom, back and neck.
 - You can **support your baby's head** with your hand if necessary.
- **Look at your baby frequently**, keep an eye on his temperature, his tiredness, his comfort, his wakefulness, check the installation and the sling strength.
- **Back carries are recommended from ten months old.**

The Bulline® Néobulle®'s ring sling baby carrier Woven and manufactured in France (Loire)

The Bulline is a «pre-installed» baby carrier, easy, comfortable and fast to use with children from 3,5 to 15 kg.

Woven and manufactured in the Loire region (France), the Bulline meets the demanding criteria of the quality standards.

The double cross twill weave gives the fabric a uniform stretch that is essential for baby's comfort.

Keeping child safety in mind, we aim for quality beyond reproach. All the dyes used on the threads are non-toxic, pollutant and heavy metal-free. The dyed threads are 100% cotton and bear the «Öko Tex 100» label.

The rings are aluminium Food, being able to be for the contact of the mouth of the child.

Caring for your Bulline®:

- wash in warm water (86 -104° Fahrenheit)
- tumble drying is possible but should remain occasional to extend your Bulline's life span.

Why carry our babies ?

When worn, babies discover the world as they snuggle against their mother or father. This way, parents can meet baby's essential need for contact and emotional security, all the while being able to go through their daily tasks.

The worn child develops a special relationship with the person carrying him. Being close to the adult, his warmth, his smell, his heartbeats, is very soothing for baby and reminds him of intrauterine safety. He feels wrapped and supported, and discovers life with confidence, gaining strong lifelong basis.

Whether he's worn in front, hip or back carries, the child is in constant physical and / or visual contact with the adult, which results in a strong feeling of well being. Wrapped in the fabric, the little one is rocked, soothed and all his senses are naturally stimulated (sight, smell, hearing, touch, balance).

Wrap carriers, whether long or short, plain or with rings, are a precious help when living with a small child. Wonderfully adjustable and versatile, they fit every wrapper / wrappee couple (whatever the size of the parents, the age the babies are or their need to be carried...) and can be used in various situations, including twins, sick or hospitalized children, parents or children with handicap.

With both hands free, the adult can go through his everyday activities as he grants his baby with those precious moments. The wrap becomes «the second pair of arms» many parents need for daily tasks or for caring for older children.

Physiological, respectful babywearing allows baby to get into the frog legged position that is so natural to him, in a wide seat, his spine perfectly supported. There are many babywearing workshops to help you learn how to properly adjust your carrier and make it comfortable, to master the various wrapping techniques, learn different carries and practice with your baby.

Happy babywearing !

Key recommendations for proper babywearing

« Right from the start, help baby get into a correct position »

A newborn naturally rests in a frog legged position. This squat must be the start of all carries, whether on the front, the hip or the back, and regardless of baby's age.

Knees are higher than the bum, the spine is curved, the pelvis tilted and the legs slightly apart.

To achieve maximum comfort for Baby and the adult :

The Bulline must be properly adjusted : the child must be high enough for kissing, and tight against the wrapper's chest.

- tighten the upper rail to get baby closer to you
- the lower rail supports baby's thighs and knees and determines how high baby is positioned

- strand by strand tightening allows precise adjustment of the pouch supporting baby's spine
- The head of the baby always has to be except the fabric, the superior air traffics (nose fills) always brought out(loosened),
- there are many babywearing groups, don't be shy to ask for help !

You will be more comfortable if you spread the fabric on your shoulder and your back :

Before

after

Ideally, the rings must be higher than your chest.

Threading the Bulline

The rails are different colors on each side to make telling them apart and adjusting easier.

- 

1 Bring both ends together, making sure the fabric is not twisted.
- 

2 Thread the fabric into both rings
- 

3 Thread it back into only one of the rings
- 

4 The fabric is bunched in the rings, the rails match on both sides of the rings

Putting the Bulline on

(baby is carried on the right hip)

- 

1 Grab the Bulline with your left hand close to the rings, the loose tail away from you.
- 

2 Get your right arm and your head into the Bulline (dive in), keeping hold of the rings.
- 

3 Place the carrier on your shoulder.
- 

4 Tighten strand by strand so the Bulline is perfectly adjusted around you.
- 

5 Loosen the fabric by pulling toward your hip as you lift the most accessible ring.
- 

6 Get the fabric at the tip of your hip for a newborn, slightly lower for an older baby.

You don't need to readjust each time if the same person is using the Bulline.

Go through the same steps to carry the Bulline on the opposite shoulder.

The Bulline now fits you and your baby.

Getting baby in front and hip carries

- knotting suitable to babies younger than 4 months old (see page 8) -

1 The rings are on top of your shoulder (they will come down after loading baby and tightening, when it's done they must be right under your collarbone).

2 Put baby high up on your shoulder and grab his feet from underneath the fabric.

3 Let baby slide into a sitting position with the fabric gathered behind his knees.

4 Pull the upper rail up to his ears.

5 Tighten the Bulline strand by strand.

To loosen the carrier, hold baby, lift the visible ring and pull it upward to get some slack. Baby can then be taken out from above or from underneath.

Baby's final position depends on how he is positioned when you get him in the carrier, it is difficult to reposition him once the carrier is adjusted.

Choose the position that is right for you :

On the front

On the hip, baby can be carried arms out if he has good head control.

Feeding baby in the Bulline

Loosen the Bulline, lift baby slightly and move his bum to get him into a reclined position.

The Bulline's loose tail can be used for discreet nursing. Baby must be placed back into a vertical position after nursing.

! - To carry in safety, refer to the page 8 and 9 -

Getting baby in back carry

- The porterage back is recommended from 10 months -

After putting the Bulline on the usual way, grab the lower rail with the hand opposite your shoulder wearing the Bulline.

Pull this rail upward to flip the fabric.

Keep hold of this rail and flip the fabric on the front so that it remains untwisted on the rings.

The lower rail becomes the upper rail. Adjust the Bulline around you (same as when you do the front carry).

Get the rings near the middle of your back.

Get baby in the Bulline and adjust as usual.

Slide baby on to your back by pulling on the tail of the Bulline, the rings come back on your shoulder and you can tighten more precisely.

Baby must be in a deep seat, the flip ensures more stability.

! - To carry in safety, refer to the page 8 and 9 -
